

Mini- Project Synopsis

TITLE: BiblioTrack – An AI-Powered Online Bookstore Management System

Problem Statement: To design an AI-powered online bookstore that overcomes the limitations of existing systems, which mainly focus only on search and purchase. The system will provide intelligent recommendations, interactive features, and personalized suggestions to help users easily discover books and connect with peers.

Description: BiblioTrack is a web-based bookstore application designed to make book discovery smarter and more engaging with AI-powered features. Users can browse by categories, genres, and authors, while a dynamic Top 10 Books section highlights trending titles based on ratings, sales, and popularity.

The system includes visual book search through cover image uploads, personalized AI recommendations, and a chatbot assistant for queries and support. An admin panel further enables efficient inventory management, sales analytics, and user management.

Expected Outcomes: The system will deliver a personalized reading experience through AI-driven recommendations and visual search. A real-time Top 10 Books list will highlight trending titles, while the chatbot ensures instant guidance. The integrated Book Club will build a community space for readers to connect, share reviews, and engage in discussions, making the platform both intelligent and interactive.

Technologies and Tools:

- **Frontend:** HTML,CSS,Javascripts
- **Backend:** Spring Boot (Java) / FastAPI (Python)/Django
- **Database:** MySQL / PostgreSQL /SQLite
- **AI/ML:** TensorFlow.js (recommendations, visual search)
- **Hosting (Optional):** Netlify/Vercel (frontend), Render/Railway (backend)

Team Members:

Harshitha S (4AI23CD019)

Prajna K S (4AI23CD038)
